TCS Cyber Threat Assessment Program

IT'S FAST AND IT'S FREE!

Your network is under constant attack and the attack surface is continually expanding. The old ways of defending your network have limited effectiveness in today's world; perimeters are routinely breached, users inadvertently click on links and open attachments, and your security staff is overwhelmed, reacting to a tsunami of alerts and alarms. Hidden among all of this noise are zero-day and advanced threats, looking to steal or destroy your data, get away with your intellectual property or competitive intelligence, or simply embarrass your organization.

Now is the time to understand the strengths and vulnerabilities of your network with the Cyber Threat Assessment Program (CTAP). TCS Canada can assess your current network security in a week, for FREE.

WITH A CYBER THREAT ASSESSMENT YOU WILL BETTER UNDERSTAND:

SECURITY AND THREAT PREVENTION
Which application vulnerabilities are attacking your network, which malware/ botnets were detected, and which devices are "at risk" for security breach probability.
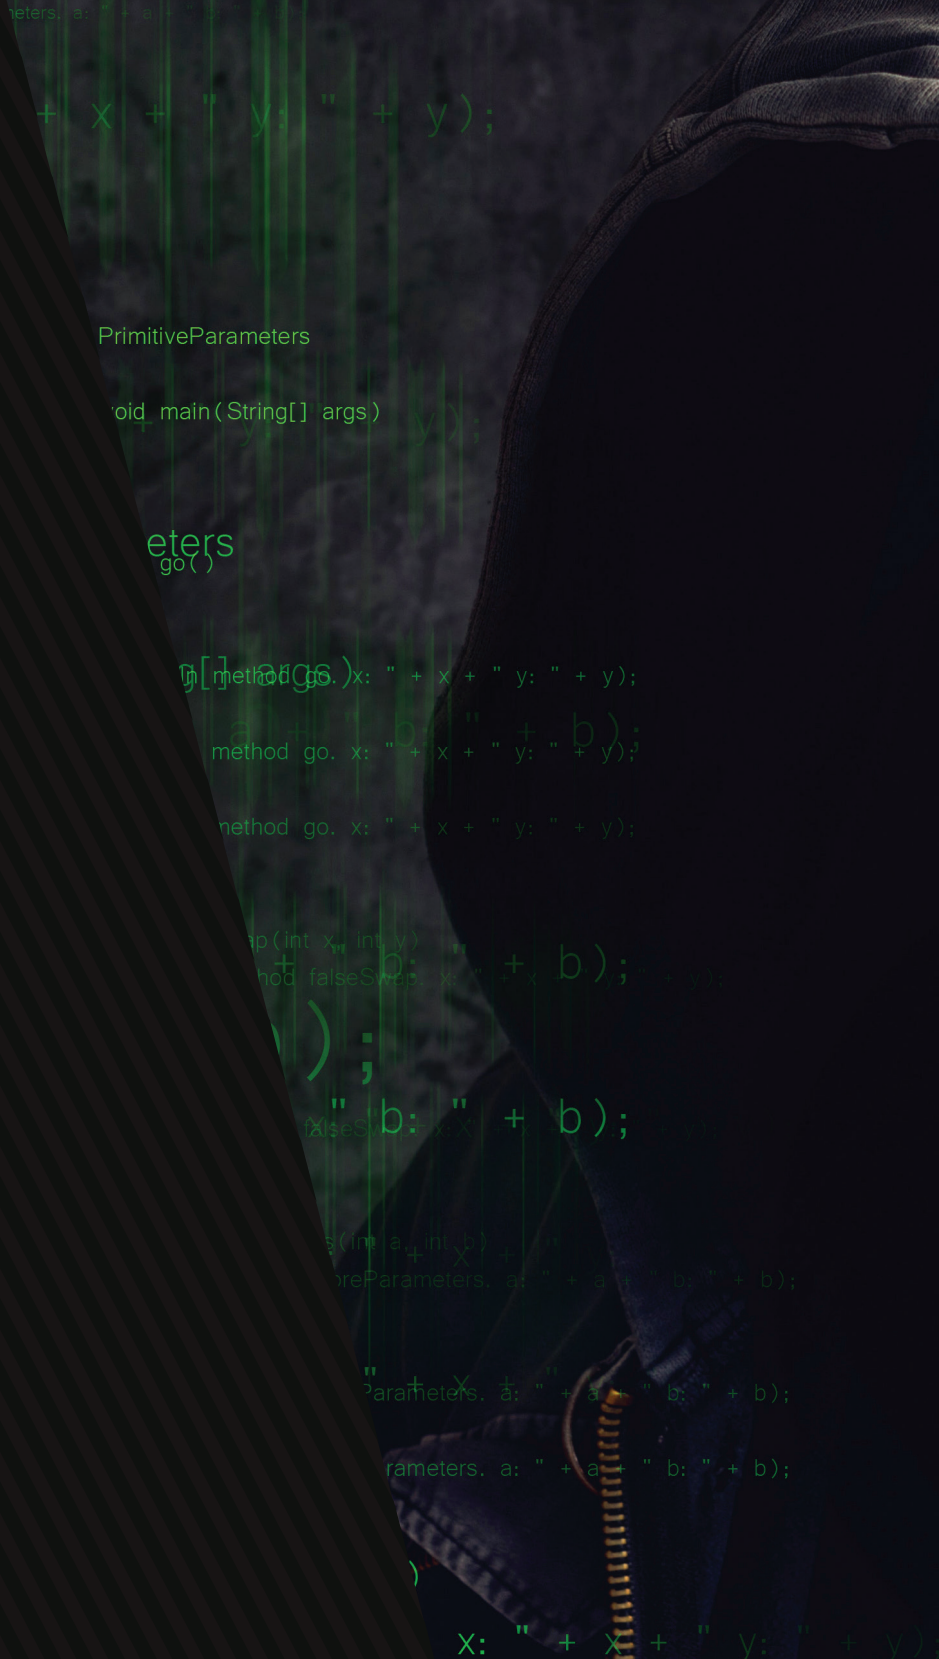

USER PRODUCTIVITY
Which peer-to-peer, social media, instant messaging, and other apps are running for application visibility control.

NETWORK UTILIZATION & PERFORMANCE
What are your throughput, session, and bandwidth usage requirements during peak hours-network utilization and monitoring test for performance optimization.
